

## Neutimes

possesses the following abilities:

1. Stimulate the body's ability to synthesize protein, reduce fat, and build muscle mass
2. Increase bone calcium, improve osteoporosis
3. Reverse nervous degradation
4. Improve cardiovascular functions
5. Improve skin tone, suppleness, and elasticity
6. Improve lung function
7. Strengthen the immune system
8. Improve muscle ability and endurance
9. Aid wound recover
10. Improve physical and mental strength
11. Reverse the effects of aging
12. Lower cholesterol
13. Influence the endocrine system and stimulate growth
14. Enhance libido

# Understanding the Growth Hormone

Growth hormone (GH) is secreted by the pituitary gland and promotes growth in children. It is essential for healthy development in children. Research has shown that growth hormones not only promote height growth, but is also effective in decreasing lipid level, increase muscle mass, and it drastically improve the overall physical health.

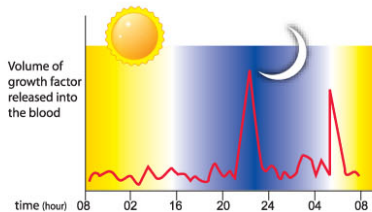

The growth hormone was first isolated from the pituitary tissue in 1956, but it only determined the structure for the growth hormone in 1972. Until the mid 1980s, growth hormones are still produced mainly from the human pituitary gland.

GH stimulates the liver's production of a protein known as insulin-like growth factor (IGF) which plays an important role in stimulate the growth of cells, tissues, and organs through a series of biochemical reactions.

However, genetic engineering technology now has allowed growth hormones to be mass produced to the benefit of more people.

Growth hormones are produced throughout the day from the pituitary glands and released directly into the blood stream. However, the amount secreted is time dependent; very little growth hormones are secreted during the day, while the secretion reaches a peak at night.

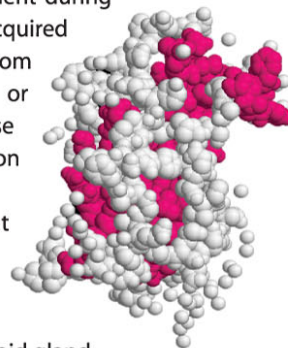

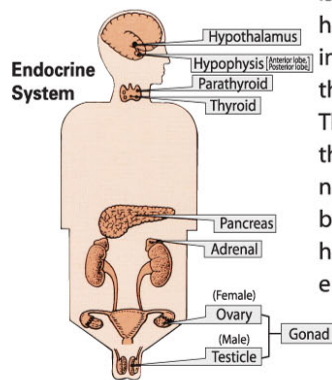

Neutimes should be taken daily before sleep in order to remain in sync with the natural biological cycle.

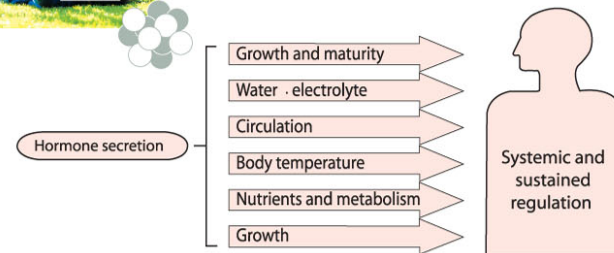

# Reasons behind growth hormone Deficiency

Growth hormone deficiency (scientifically known as panhypopituitarism) can be attributed to several reasons; the chief being defects of the hypothalamus or pituitary gland which results in the insufficient production of growth hormone in the pituitary gland. In some extremely rare cases, the patient's body produces the normal amount of growth hormone but the body is unable to utilize it due to some defects. Congenital pituitary insufficiency can be traced to abnormal hypothalamus development during the fetal stage. On the other hand, acquired pituitary insufficiency can arise from damages to the hypothalamus or pituitary gland due to injury, disease damage, side effects of radiation therapy, brain tumor, etc.

There are more than 80 different hormones in the human body and most of which are produced by the endocrine glands. The endocrine glands include pituitary gland, thyroid gland, adrenal gland, pancreas, ovary, and testis. The pituitary gland is the master gland which handles the secretion of many important hormones, including the important growth hormone. The pituitary gland controls all the organs, tissue growth, normal operation of the human body, as well as stimulate hormone secretion in the other endocrine glands.

# The Mysteries of Neutimes

The growth hormone controls the healthy gain in height, body shape, and organ development. It remains at its peak level of 600mg in the blood stream till a person reaches 25 years of age. The level begins to decrease and only about 15% remains when the person reaches 60-70 years of age. People who do not take in sufficient nutrients will even find themselves hitting the 15% mark when they reach 40 - 50 years old. People who suffer from growth hormone deficiency appear older and weaker than their peers. On the other hand, people with sufficient growth hormone in their body have healthier reproductive organs, which in turns regulate healthy secretion of reproductive hormones. The healthy balance of growth hormone not only make a person more beautiful, it also reduces double chin, beer-belly in man, belly fats and cellulite in female, as well as reduce fat accumulation at undesirable location. It is especially beneficial to postpartum women who need to firm up their sagging muscles to return to their pre-pregnancy beautiful figure. Women who experience early menopause (45 - 50) can experience revived ovarian functions and reap the benefit of menstruation such as osteoporosis prevention, reduced body pain, decrease dry and wrinkled skin, and restore skin to its most beautiful state.

### Direction for Use:

- Age 25 or above, 1 time daily
- Age 40 or above, 1-2 time daily
- Recommendation usage: 2 sprays on tip of the tongue  
3 sprays under tongue
- Recommendation for continuous health care can be regulated freely according to a person's living and eating habit
- Take 5 days consecutively and stop for 2 days as one week of treatment period

\* Please consult Neucor Health Consultant for a treatment plan. Kindly pay attention to the reverse reaction during the treatment period.
